

Interview Questions

Q: What is FluentValidation?

Answer:

FluentValidation is a popular .NET validation library that allows validation rules to be defined separately from business logic using a fluent syntax.

Q: Why use FluentValidation instead of validation inside controllers?

Answer:

It separates validation concerns from controllers and services, improves maintainability, readability, and testability, and follows the Single Responsibility Principle.

Q: What are the benefits?

Answer:

- Cleaner controllers
- Reusable validation rules
- Better maintainability
- Easy unit testing
- Consistent validation across the application

Q: Where should validators be placed in Clean Architecture?

Answer:

Validators are usually placed in the Application layer because they validate application requests before business logic executes.

Q: What happens when validation fails?

Answer:

The request is rejected before reaching the service layer, and validation errors
